# RANGER

VALVE AMERICA

Ranger Valve America Ltd. (Ranger™) is a specialized supplier of API 6D, API 600, API 6A and API 16C valves and flow control components, including industrial valves and wellhead equipment.

Ranger™ works closely with its partners and strives to exceed expectations.

Ranger™ works to provide a rigorous research and development program aimed at product design, innovation and validation. Ranger™ uses a full spectrum of inspection and test equipment to ensure that all products meet or exceed the quality standards, including:

- Mechanical: tensile, impact and hardness testing;
- NDE: PT, MT, UT
- Chemical: PMI
- Fugitive emission
- Shell type acceptance test(TAT).

As well, Ranger™ simulates various tests in critical and crucial working conditions to verify product performance.

# FEATURES

The Ranger™ series of forged and cast trunnion ball valves have been engineered to meet both general and severe service applications and are appropriate for use in industries including petroleum, refining, transmission/pipeline, petro-chemical, and others. Ranger™ valves are designed in accordance with API 6D and CSA Z245.15, they are available in a variety of configurations and materials to meet your specific operational needs. Combined with our industry leading 48/24 month extended warranty, Ranger™ valves not only meet but exceed industry standards.

## FEATURES

- Valve body, closures, ball and seat carriers are manufactured from forged steel to ensure high strength, dependable service life in high pressure or severe applications.
- Available seat configurations include self-relieving (single piston effect), DIB-1 (double piston effect) and DIB-2 (single piston one side, double piston one side) options.
- DIB-1 valves are provided with drilled, tapped, plugged ports for ease of thermal relief piping as necessary.
  - The primary seat design utilizes TEFLON, DEVLON or PEEK as standard dependent upon pressure class, the secondary metal seat ring will provide sealing should the primary be eliminated by fire per API 607.
    - All seat rings and O-rings include graphite secondary seals to achieve firesafe requirements for API 607.
  - All o-rings are meet anti-explosive decompression requirements.
- All sizes/ANSI classes are double block and bleed capable in accordance with API 6D.
- The drain valve can be utilized for block and bleed function or to check seat integrity during maintenance.
- All sizes/classes are provided with emergency stem and seat injection capabilities in the event of damage. Valves  $\geq 16''$  are provided with 2 seat injection ports. Small bore valves  $\leq 4''$  will be provided with center body cavity injection due to size constraints.
- The valves are hydro tested excluding the injection fittings as there is a buried check valve installed underneath the fittings in the valve body. Therefore, a damaged fitting can be replaced without the need to re-hydro test the valve shell (body integrity remains intact).
- Valve stems are anti-blowout, designed in accordance with API 6D to ensure body cavity pressure cannot eject stem.
- The design incorporates two springs to assure electric continuity between the stem/body/ball to eliminate static build-up.
- The mounting pad provided is standard to ISO 5211 for ease of automation.
- All valves are standard with a lockable handle or gear per API 608.

## ADDITIONAL OPTIONS

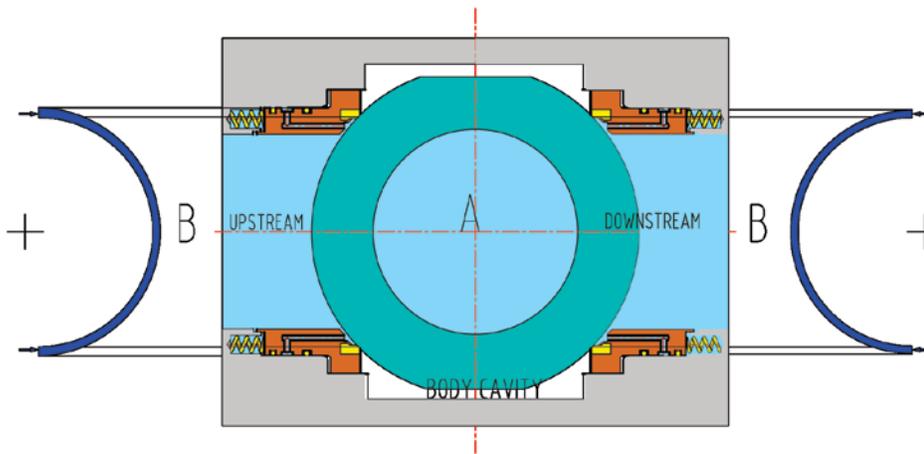

- Ranger™ valves are available as standard with ASTM A105 or A350-LF2 bodies, 3MIL ENP or 316SS trim components and polymer seats. Alternate materials can be provided based upon application specifics.
- Cryogenic designs and test capabilities are available.
- For severe service (high temperature or abrasive media), metal seated design options can be provided.
- Valves are provided with factory enamel coating, custom coating or colors can be offered based upon specific needs.
- Additional testing or documentation is available and can be offered as required.

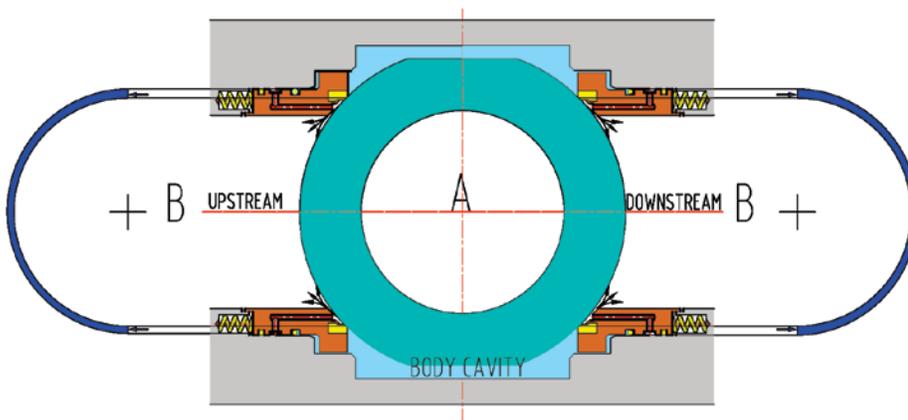

# SELF-RELIEVING, DIB-1, AND DIB-2 SEAT DESIGN

SELF-RELIEVING (SINGLE PISTON EFFECT): For this design, the seat retains tight contact with the ball in one direction. The line pressures upstream and downstream act upon the back of the seat retainers to force each of the seat rings more tightly against the ball. In the event that the body cavity pressure exceeds either the upstream or downstream line pressure, the body pressure will create a thrust that will push the seat ring away from the ball and allow the pressure to equalize between the cavity and the line. This overpressure release can occur in either the full open or close valve position. This style of valve is fully bi-directional for installation.

PRESSURE ACTING UPSTREAM AND/OR DOWNSTREAM PRESSURE  $B > A$   
A=BODY CAVITY PRESSURE, B=LINE PRESSURE

PRESSURE ACTING IN THE BODY CAVITY PRESSURE  $A > B$   
A=BODY CAVITY PRESSURE, B=LINE PRESSURE

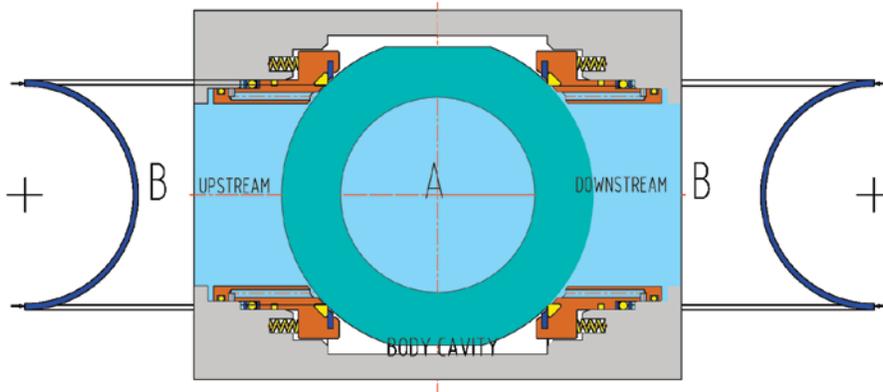

## DIB-1 (DOUBLE PISTON EFFECT)

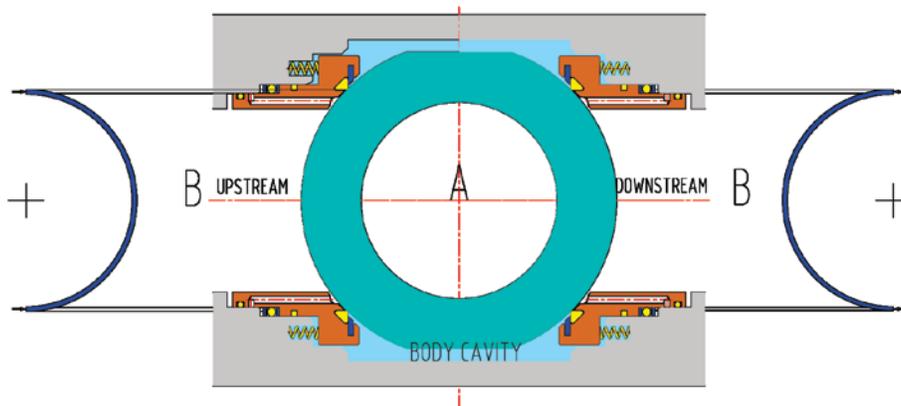

In the double piston effect design, the seat remains in tight contact with the ball in both directions. The line pressures upstream, downstream and in the body cavity will all act to increase the thrust forcing the seats into the ball. Therefore in full open or closed positions, the media in the body cavity will always be fully isolated from the line media. Dependent upon the application, this design of valve may require additional pressure relief devices to protect the valve in case of over-pressure of the body cavity. A common example of this

requirement would be a liquid service where the media is subject to thermal expansion. This valve is also fully bi-directional for installation purposes, though if provided with cavity pressure relief piped to the flange, the valve would need to be installed so the media pressure release discharges to the upstream or downstream side based upon site requirements.

PRESSURE ACTING UPSTREAM AND/OR DOWNSTREAM PRESSURE  $B > A$   
 $A = \text{BODY CAVITY PRESSURE}$ ,  $B = \text{LINE PRESSURE}$

PRESSURE ACTING IN THE BODY CAVITY PRESSURE  $A > B$   
 $A = \text{BODY CAVITY PRESSURE}$ ,  $B = \text{LINE PRESSURE}$

## DIB-2 - SAFE RELIEVING (ONE SINGLE PISTON SEAT + ONE DOUBLE PISTON EFFECT SEAT)

The DIB-2 design incorporates one of each seat in the valve construction. This will create a unidirectional valve with the double piston effect seat typically protecting the downstream line. In the case of body cavity pressure exceeding the line pressure, the single piston effect seat will allow for

pressure to relieve (typically upstream) and equalize. There is no need to provide for additional pressure relief with this design, as it provides for the relief through the single piston effect seat.

## ADDITIONAL NOTES

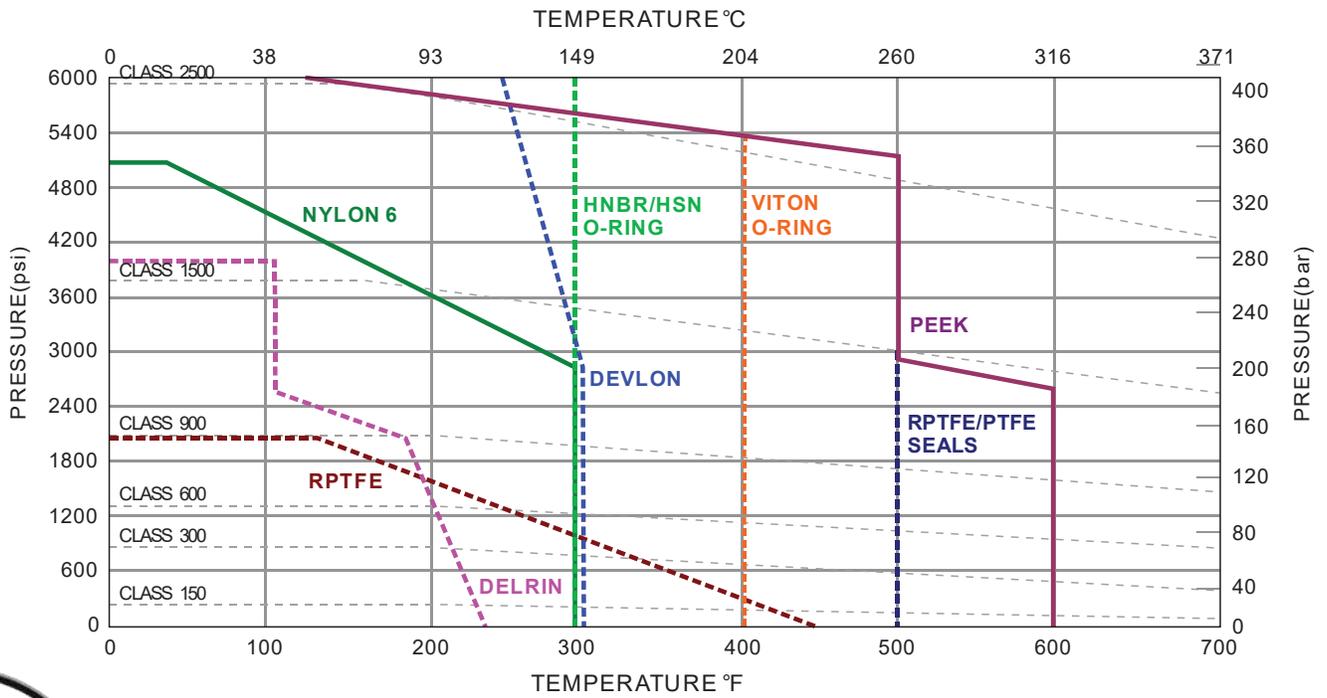

1. Torque values above are for new valves in clean water service.
2. Torque values are in inch pound, and excluded a safety factor.
3. Required safety factor is 1.35.
4. For unclean service, an additional safety factor of 30% is required.
5. For dry gas service, an additional safety factor of 50% is required.
6. Torques reflect valve bore, for RP select appropriate bore size.
7. Torques above are based upon standard seat insert offerings. Class 150 & 300: PTFE; Class 600: DEVLON; and Class 2500: PEEK. Consult Ranger for torques for different seat materials.
