## Installation and Operation Manual

TMC4 Modbus RTU Module Single and Dual Channel

Single Channel
TMC-4C005-001

Dual Channel
TMC-4C005-003

## 1. Overview

The Triac Modbus RTU module is a plug-in option module for use with the TMC4 controller providing communication with the TMC4 control card through Modbus RTU protocol. The module is available in both a single isolated channel, item TMC-4C005-001, and dual isolated channel, item TMC-4C005-003. The dual channel module supports communication via two independent ports under one ID. This dual channel configuration is useful for operating physically redundant networks. Wiring, communication parameters, and best practices are all common between the single and dual channel module operation.

### 1.1. Features

- Addresses from 1 to 246
- None, Odd or Even parity
- 9600, 19.2k, 57.6k, 115.2k baud rates

### 1.2. Installation

The TMC4 Modbus module is installed in the TMC4 control board option module slot using (2) 4-40 $\times 1 / 4$ " screws. Insert card edge in the mini PCl express connector and rotate module flat to secure with the screws.

### 1.3. Wiring

The wiring pinout for each module is shown below.

## 2. Network

For best results, a RS-485 cable with recommended $120 \Omega$ characteristic impedance should be used for network wiring. For the dual channel module, separate RS-485 communication cables must be used for both Network 1 and Network 2 as shown. For single channel module, only Network 1 cabling is required.

A $120 \Omega$ termination resistance at master and last slave node on the network is required for best performance. Maximum number of nodes per multi-drop network should be limited to 32 nodes. If greater than 32 nodes are required on a network, repeaters should be utilized.

Polling nodes simultaneously on both ports for a dual channel network should be avoided. A minimum 500 ms polling rate and delay of 20 ms between polls of the same device on both channels is recommended.

NETWORK 1

Maximum 32 nodes per multi-drop network

### 2.1. Network Topology

The Modbus module should be wired in either a daisy chain topology, or a backbone with stubs for best results. If backbone with stubs topology is used, the length of stubs should be kept as short as possible. Star, ring, or combinations thereof, should be avoided.

### 2.2. Cable Length

The theoretical maximum cable length for RS-485 network is 1.2 km ( 3900 feet). This also includes the length of any network stubs used. Maximum cable length decreases as the data rate increases as shown below. Other considerations may decrease actual maximum cable length, such as characteristic impedance mismatch of cable to master.

## 3. Setup

To operate with Modbus RTU commands, the TMC4 controller must first be configured for Modbus RTU communication. Refer to TMC4 IOM for details.

- Set Command Type in the COMMAND CONFIG submenu to Comms.
- Set Position Type in the POSITION CONFIG submenu to either Limit Switch or Potentiometer depending on if on/off actuation or proportional/modulating actuation.
- If operating as Potentiometer positioning, program the $0 \%$ and $100 \%$ positions in the Calibrate Close and Calibrate Open setting.
- Set Communication Type in the COMMS CONFIG submenu to Modbus RTU.
- Set unit address, baud rate and parity in the COMMS CONFIG submenu.

## 4. Operation

### 4.1. Limit Switch Positioning Operation

When operating with limit switches for on/off or two position control, the TMC4 Position Type setting in the POSITION CONFIG submenu should be set to Limit Switch. When operating in this mode, Bit 1 and Bit 2 in Register 40009 control the actuator direction and movement. The actuator can also be controlled by writing specific values to Register 40010. Bits $1-4$ in Register 40001, provide the feedback information about the travel direction and end of travel position of the actuator. Operating details are provided below.

| OPERATION <br> Register 40009, Action Bits/Flags 2 |  |  |
| :---: | :---: | :--- |
| Bit 2 | Bit 1 | Description |
| 0 | x | De-energize motor outputs <br> and stop actuator. |
| 1 | 0 | Energize motor outputs and <br> drive actuator CW. |
| 1 | 1 | Energize motor outputs and <br> drive actuator CCW. |

| OPERATION <br> Register 40010, Command Position |  |
| :---: | :--- |
| Value | Description |
| 0 | Energize motor outputs and <br> drive actuator CW. |
| 500 | De-energize motor outputs <br> and stop actuator. |
| 1000 | Energize motor outputs and <br> drive actuator CCW. |

FEEDBACK
Register 40001, Status Flags 1

| Position |  |  | Movement |  | Description |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 4 | Bit 3 |  | Bit 2 | Bit 1 | Position | Movement |
| 0 | 0 |  | 0 | 0 | Between limits | Stopped |
| 0 | 0 |  | 0 | 1 | Between limits | CCW |
| 0 | 0 |  | 1 | 0 | Between limits | CW |
| 0 | 0 |  | 1 | 1 | $?$ | $?$ |
| 0 | 1 |  | 0 | 0 | CCW limit | Stopped |
| 0 | 1 |  | 0 | 1 | $?$ | $?$ |
| 0 | 1 |  | 1 | 0 | CCW limit | CW |
| 0 | 1 |  | 1 | 1 | $?$ | $?$ |
| 1 | 0 |  | 0 | 0 | CW limit | Stopped |
| 1 | 0 |  | 0 | 1 | CW limit | CCW |

(1) This state will be present immediately when reversing direction until the position cam disengages the position limit switch. If this state persists, it may indicate jam or obstruction condition.

Note that even though the motor stops when the destination travel limit switch is closed, the motor outputs of the control board remain energized until a stop command is written to Register 40009 or 40010.

In Register 40009, Bit 1 establishes the direction of actuator travel and Bit 2 energizes or de-energizes the motor output corresponding to the direction determined by Bit 1.

If Bit $1=0$, the actuator is set to move in the CW direction. If Bit $1=1$, the actuator is set to move in the CCW direction.
If Bit $2=0$, the motor output is not energized. If Bit $2=1$, the CW motor output is energized when Bit $1=0$ and the CCW motor output is energized when Bit $1=1$. Unless Bit 2 is cleared, the actuator will continue to move in the specified direction until the corresponding end of travel limit switch closes.

It is acceptable to change direction with Bit 1 while maintaining Bit $2=1$. If the direction is changed while the actuator is moving, a short delay occurs before the actuator begins moving in the opposite direction.
Writing values shown in Error! Reference source not found. into Register 40010 will automatically set Bit 1 and Bit 2 in Register 40009 according to the action specified.

CAUTION! When writing to Bit 1 and Bit 2 of Register 40009, be careful not to change the other register bits.
In Register 40001, Bit 1 and Bit 2 indicate the direction of travel. Bit 3 and Bit 4 indicate if the actuator is at the full CCW or full CW limit respectively.

While the actuator is moving in the CW direction, Bit $2=1$. When the actuator reaches the CW end of travel limit switch, Bit $2=0$ and Bit $4=1$. The CW motor output is de-energized.

While the actuator is moving in the CCW direction, Bit $1=1$. When the actuator reaches the CCW end of travel limit switch, Bit $1=0$ and Bit $3=1$. The CCW motor output is de-energized.

### 4.2. Potentiometer Positioning Operation

When operating with feedback potentiometer for proportional or modulating control, the TMC4 Position Type setting in the POSITION CONFIG submenu should be set to Potentiometer. In this mode, the actuator is controlled using the Command Position Register 40010, and the Sensitivity/Deadband Register 40013. Note, the deadband can also set by the on-board menus. The actual location of the actuator is indicated by the Current Position Register 40008.

When a new command position value is written to Register 40010, the new value is compared to the current position value in Register 40008. If the difference between the two values is greater than the sensitivity/deadband value in Register 40010, the actuator begins moving towards the new command position. When the current position value is within the limits of the command position and sensitivity/deadband value in Register 40010, the actuator is stopped.

Bit 1 and Bit 2 in Register 40001 are also used to indicate the direction of travel. If the actuator is moving in the CW direction, Bit $2=1$. If the actuator is moving in the CCW direction, Bit $1=1$. When the actuator reaches the command position value and is stopped, Bit 1 and Bit 2 will equal 0 .

### 4.3. Obstruction or Jam Detection

When a move command is given by either setting Bit 1 and Bit 2 in Register 40009, or by writing valid value to Register 40010, a timer is immediately started. The timer continues to increment once every second. After each increment, the timer value is compared to the value set in Register 40011 for the Travel Timeout.

If the destination travel limit switch closes, or the position setpoint is reached before the timer value is greater than the value in Register 40011, the actuator is operating normally.

If the destination travel limit switch IS NOT closed, or the position setpoint is not reached before the timer value is greater than the value in Register 40011, a jam or obstruction has prevented the valve from operating properly. The active motor output is de-energized, and Bit 5 in Register 40001 is set.

## 5. Modbus

### 5.1. Function Codes

The TMC4-M module is a Modbus slave that supports the following Modbus functions.

| Code | Code <br> (hex) | Code Definition |
| :--- | :--- | :--- |
| 03 | $0 \times 03$ | Read Holding Registers |
| 16 | $0 \times 10$ | Write Multiple Registers |

Function 03 reads the contents of a contiguous block of holding registers. All registers, 40001-40017 are readable with this function.

Function 16 writes values into a sequence of adjacent holding registers. Only registers, 40009-40017 can be written to with this function.

### 5.2. Registers

All registers are 16 bits in length. When the register is addressed in the data communications, the register is assigned a hexadecimal value starting with $0 \times 00$. Therefore, registers numbered 40001-40017 are addressed as $0-16$ in decimal, or $0 \times 00$ to $0 \times 10$ in hexadecimal resulting in the register always addressed one value below the specified decimal register number.

| Register No. | Register Address | Address Name | 16 bit / Digital Name | Unit | Scale | Range | Default | Read / Write |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 40001 | 0x00 | STATUS FLAGS 1 INT |  |  |  |  |  |  |
|  |  | bit 1 | CCW Movement | Bit | N/A | True/False | N/A | Read |
|  |  | bit 2 | CW Movement | Bit | N/A | True/False | N/A | Read |
|  |  | bit 3 | CCW Travel Limit | Bit | N/A | True/False | N/A | Read |
|  |  | bit 4 | CW Travel Limit | Bit | N/A | True/False | N/A | Read |
|  |  | bit 5 | Actuator Obstructed | Bit | N/A | True/False | N/A | Read |

TMC4 Control Card for Electric Actuators

## CONTROLS

Installation \& Maintenance Manual

## Status Flags 1 Register

| Register Number | 40001 | Unit | Scale | Range | Default |
| ---: | :--- | :---: | :---: | :---: | :---: |
| Register Address | $0 \times 00$ | $n / a$ | $n / a$ | $n / a$ |  |
| Read/Write | $R$ |  |  |  |  |

The Status Flags 1 register provides flags to indicate various status and operating conditions. The register bits are assigned the functionality provided below.

| Bit | Description |
| :--- | :--- |
| Bit 1 | CCW Movement bit indicates if the CCW motor output terminal is energized and is used to indicate CCW movement. |
| Bit 2 | CW Movement bit indicates if the CW motor output terminal is energized and is used to indicate CW movement. |
| Bit 3 | CCW Travel Limit bit indicates if the open travel limit switch is closed. |
| Bit 4 | CW Travel Limit bit indicates if the close travel limit switch is closed. |
| Bit 5 | Actuator Obstruction bit indicates if the time set in the Travel Timeout register 40011 has been exceeded before the <br> actuator reaches its appropriate end of travel position. |
| Bit 6 | Not used |
| Bit 7 | Positioning Mode bit indicates if the Position Type in the menus is set to Limit Switch or Potentiometer. Limit Switch is <br> for two position control using limit switches for position feedback. Potentiometer is used for proportional or modulating <br> control using a potentiometer for position feedback. |
| Bit 8 | Operating Mode bit indicates if the controller is in Run mode or Configuration mode. The controller is considered to be in <br> configuration mode when entering into any of the configuration submenus. |
| Bit 9-16 | Not used |

| Byte 1 (LSB) |  |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

TMC4 Control Card for Electric Actuators

## Total Power On Time / Firmware

| Register Number | 40002 / 40003 | Unit | Scale | Range | Default |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Register Address | 0x01/0x02 | Hour | 1 | $\begin{gathered} 0-16,777,216 \\ 0 \times 00000000-0 x 00 F F F F F F \end{gathered}$ | n/a |
| Read/Write | R | Version | 1 | $\begin{gathered} 0-255 \\ 0 \times 00-0 \times F F \end{gathered}$ | n/a |

| 40002 |  |  |  |  |  |  |  |  | 40003 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte 2 (MSB) | Byte 1 (LSB) |  |  |  |  |  |  |  | Byte 2 (MSB) |  |  |  |  |  |  |  | Byte 1 (LSB) |  |  |  |  |  |  |  |
| B16 $\mathrm{B} 15\|\mathrm{~B} 14\| \mathrm{B} 13\|\mathrm{~B} 12\| \mathrm{B} 11\|\mathrm{~B} 10\| \mathrm{B} 9$ | B8 | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B16 | B15 | B14 |  | B12 |  | B10 | B9 | B8 | B7 | B6 | B5 | B4 | B3 | B2 | B1 |
| Firmware Version | Total Powered On Time |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0-255 | $0-16,777,216$ (hours) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

The Total Power on Time/Firmware registers store the total time (in hours) the board has been powered on as well as the current version of the firmware. The firmware version is stored in the upper 8 bits of Register 40002. The lower 8 bits of Register 40002 and all 16 bits of Register 40003 contain the 24 -bit value representing the time the board has been powered on, providing for between 0 and 16,777,216 hours. This value resets when board power is removed.

When reading the registers, the 8 bits in Register 40002 represent the most significant bits of the time, while all 16 bits in Register 40003 represent the least significant bits of the time. It is recommended to read both registers with the same command. In order to extract the length of time the board has been powered on, the upper 8 bits of Register 40002 must be masked off. In order to extract the firmware version, the lower 8 bits of Register 40002 must be masked off.

## Total Motor Run Time

| Register Number | 40004 / 40005 |
| ---: | :--- |
| Register Address | $0 \times 03 / 0 \times 04$ |
| Read/Write | $R$ |

| Unit | Scale | Range | Default |
| :---: | :---: | :---: | :---: |
| Hour | 1 | $0-16,777,216$ | $\mathrm{n} / \mathrm{a}$ |

| 40004 |  |  |  |  |  |  |  |  | 40005 |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte 2 (MSB) | Byte 1 (LSB) |  |  |  |  |  |  |  | Byte 2 (MSB) |  |  |  |  |  | Byte 1 (LSB) |  |  |  |  |  |  |  |
|  | B8 | B7 | B6 | B5 | B4 | B3 | B2 | B1 | B16 | B15 B14 | B13 | B12 | B11 B10 | B9 | B8 | B7 | B6 | B5 | B4 | B3 | B2 | B1 |
| - |  |  |  |  |  |  |  |  |  | 0-16, | 777, | 216 | (hours) |  |  |  |  |  |  |  |  |  |

The Total Motor Run Time registers store the total combined time (in hours) the CW and CCW motor outputs of the board have been energized. The lower 8 bits of Register 40004 and all 16 bits of Register 40005 contain the 24 -bit value, providing for between 0 and 16,777,216 hours. This value resets when board power is removed.

When reading the registers, the 8 bits in Register 40004 represent the most significant bits of the time, while all 16 bits in Register 40005 represent the least significant bits of the time. It is recommended to read both registers with the same command.

TMC4 Control Card for Electric Actuators

## Total Motor Starts

| Register Number | 40006 / 40007 |
| ---: | :--- |
| Register Address | $0 \times 05 / 0 \times 06$ |
| Read/Write | $R$ |

| Unit | Scale | Range | Default |
| :---: | :---: | :---: | :---: |
| Count | 1 | $0-16,777,216$ | $\mathrm{n} / \mathrm{a}$ |

The Total Motor Starts registers store the total count for number of times the CW and CCW motor outputs of the board have been energized. The lower 8 bits of Register 40006 and all 16 bits of Register 40007 contain the 24 -bit value, providing for between 0 and 16,777,216 total number of starts. This value resets when board power is removed.

When reading the registers, the 8 bits in Register 40006 represent the most significant bits of the count, while all 16 bits in Register 40007 represent the least significant bits of the count. It is recommended to read both registers with the same command.

## Current Position

| Register Number | 40008 |
| ---: | :--- |
| Register Address | $0 \times 07$ |
| Read/Write | $R$ |

| Unit | Scale | Range | Default |
| :---: | :---: | :---: | :---: |
| $\%$ | 0.1 | $0-1000$ <br> $0 \times 0000-0 \times 03 E 8$ | $\mathrm{n} / \mathrm{a}$ |

The Current Position register is used to track the current actuator position in potentiometer positioning using a feedback potentiometer. The range is automatically scaled based on the calibrated $0 \%$ and $100 \%$ positions.

The values in the register span from 0 to 1000, which corresponds to $0.0 \%$ and $100.0 \%$ respectively. With $0.0 \%$ representing a fully closed actuator, and $100.0 \%$ representing a fully open actuator, a value of 674 represents the actuators is $67.4 \%$ open.

The Action Bits/Flags 2 register provides individual bits for multiple operation settings as well as resettable flags used to indicate various status changes.

| Bit | Description |
| :--- | :--- |
| Bit 1 | Direction bit sets the direction to move the actuator when using limit switch positioning. Use this bit with Bit 2 to move <br> the actuator in on/off applications. The status of this bit determines which motor output is energized when Bit 2 is set. |
| Bit 2 | Output Status bit energizes the motor output determined by Bit 1. Set the desired travel direction with Bit 1 and either <br> turn on or off the motor output with this bit. |
| Bit 3 | Reset bit resets registers 40001 (bits 1-6), 40009 (bits 1-4), 40010. |
| Bit 4-6 | Not used |
| Bit 7 \& 8 | Fault Action bits determine the movement when the time between communication exceeds the Communication Timeout <br> value in Register 40014. This can also be configured in the on-board menus. |
| Bit 9-16 | Not used |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte 2 (MSB) |  |  |  |  |  |  |  |  | Byte 1 (LSB) |  |  |  |  |  |  |  |  |
| B16 | B15 | B14 | \|B13 | 13 B12 | B11 | 1 B10 | B9 |  | B8 | B7 | B6 | B5 | B4 | B3 | B2 |  | B1 |
| 0-1000 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0.0\% to 100.0\% |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

If a value outside of the acceptable range of 0 to 1000 is written, the actuator will not move. When control board has power applied, or is reset using Bit 3 in Register 40009, Bit 16 is set to 1 resulting in a value of 32,768 added to the value currently in the register. Setting Bit 16 forces the Command Position register value outside of the acceptable 0 to 1000 range and therefore prevents the actuator from moving. The actuator can be controlled again by writing another value between 0 and 1000.

The Command Position register is used to initiate an actuator move. When the board is configured for potentiometer positioning, the values span from 0 to 1000 , corresponding to $0.0 \%$ and $100.0 \%$ respectively. Therefore, with $0.0 \%$ representing a fully closed actuator, and $100.0 \%$ representing a fully open actuator, a written value of 674 indicates a command to move the actuator to $67.4 \%$ open.

When the board is set to limit switch positioning, a 0 will move the actuator CW, a 500 will stop the actuator, and 1000 will move the actuator CCW.

| Value | Description | Register 40009 bit equivalent |
| :---: | :--- | :---: |
| 0 | Energize motor outputs and drive actuator CW. | Bit $1=0$, Bit $2=1$ |
| 500 | De-energize motor outputs and stop actuator. | Bit $1=x$, Bit $2=0$ |
| 1000 | Energize motor outputs and drive actuator CCW. | Bit $1=1$, Bit $2=1$ |

## Travel Timeout

| Register Number | 40011 | Unit | Scale | Range | Default |
| ---: | :--- | :---: | :---: | :---: | :---: |
| Register Address | $0 \times 0 \mathrm{~A}$ | Second | 1 | $5-255$ | 60 |
| Read/Write | R/W |  |  |  |  |

The Travel Timeout register is to determine a stall or obstruction condition identified by Bit 5 in Register 40001. The value stored in this register represents the maximum time allowed between energizing a motor output and reaching the command position or limit before identifying an obstruction. This value should typically be set greater than the normal travel time of the actuator from full open to full close.

Values in this register can be between 5 and 255 with each integer representing 1 second. The default value is set to 60 representing a time of 60 seconds.

TMC4 Control Card for Electric Actuators

## Reserved

| Register Number | 40012 |
| ---: | :--- |
| Register Address | $0 \times 0 \mathrm{~B}$ |
| Read/Write | R / W |

| Unit | Scale | Range | Default |
| :---: | :---: | :---: | :---: |
| $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ | $\mathrm{n} / \mathrm{a}$ |

This register is currently not used.

## Sensitivity/Deadband

| Register Number | 40013 | Unit | Scale | Range | Default |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Register Address | 0x0C | \% | 0.1 | $\begin{gathered} \hline 1-25 \\ 0 \times 0001-0 \times 0019 \end{gathered}$ | 5 |
| Read/Write | R / W |  |  |  |  |

The Sensitivity/Deadband register stores the necessary change between the value written to Register 40010 and the current value in Register 40008 before an actuator movement is initiated. It also represents the range outside of the setpoint the actuator will stop.

Values in this register can be between 1 and 25 with each integer representing $0.1 \%$. The default value is set to 5 representing $0.5 \%$. Using the default value of $0.5 \%$, if the actuator position is at $50.0 \%$, indicated by a value of 500 in Register 40008, the value written to Register 40010 must be greater than 505 or less than 495.

## Communication Timeout

| Register Number | 40014 | Unit | Scale | Range | Default |
| :---: | :--- | :---: | :---: | :---: | :---: |
| Register Address | $0 \times 0 \mathrm{D}$ | $100-10,000$ <br> $0 \times 0064-0 \times 2710$ | 1000 |  |  |
| Read/Write | R / W |  |  |  |  |

| 40014 |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Byte 2 (MSB) |  | Byte 1 (LSB) |  |  |  |  |  |  |  |
| B16 ${ }^{\text {B15 }}$ \| $\mathrm{B} 14 \mid \mathrm{B} 13$ | B12 B11 B10 B9 | B8 | B7 | B6 | B5 | B4 | B3 | B2 | B1 |
| 100-10,000 |  |  |  |  |  |  |  |  |  |
| 0.1 Seconds to 100 Seconds |  |  |  |  |  |  |  |  |  |

The Communication Timeout register stores the maximum time allowed with no communication received from the master device before entering a fault condition. When this time is exceeded, the actuator will move to the position set by Bit 7 and Bit 8 in Register 40009. The master should communicate with each actuator on the bus within the time set in this register. Doing so will ensure the actuator moves to the fault position determined by Bit 7 and Bit 8 in Register 40009 only when an unintended lapse in communication is encountered.

Values in this register can be between 100 and 10,000 with each integer representing 0.01 seconds. The default value is set to 1000 representing 10 seconds.

| 0.0\% to 100.0\% |  |  |  |  |  |  |  |  |  |  |  |

The Fault Position register is used in potentiometer positioning to set a position to move the actuator for a fault condition. The values in the register span from 0 to 1000 , which corresponds to $0.0 \%$ and $100.0 \%$ respectively. With $0.0 \%$ representing a fully closed actuator, and $100.0 \%$ representing a fully open actuator, a value of 674 represents the actuator will fail to the 67.4\% open position either from fault condition.

Failing to the position specified in this register when a fault condition occurs is achieved by setting both Bit 7 and Bit 8 in Register 40009 high.

A-T Controls product, when properly selected, is designed to perform its intended function safely during its useful life. However, the purchaser or user of A-T Controls products should be aware that A-T Controls products might be used in numerous applications under a wide variety of industrial service conditions. Although A-T Controls can provide general guidelines, it cannot provide specific data and warnings for all possible applications. The purchaser / user must therefore assume the ultimate responsibility for the proper sizing and selection, installation, operation, and maintenance of $A-T$ Controls products. The user should read and understand the installation operation maintenance (IOM) instructions included with the product and train its employees and contractors in the safe use of A-T Controls products in connection with the specific application.

While the information and specifications contained in this literature are believed to be accurate, they are supplied for informative purposes only. Because A-T Controls is continually improving and upgrading its product design, the specifications, dimensions and information contained in this literature are subject to change without notice. Should any question arise concerning these specifications, the purchaser/user should contact A-T Controls.
